

MeterTrac

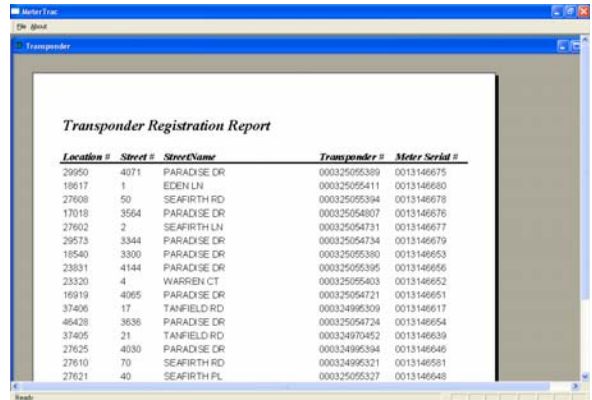

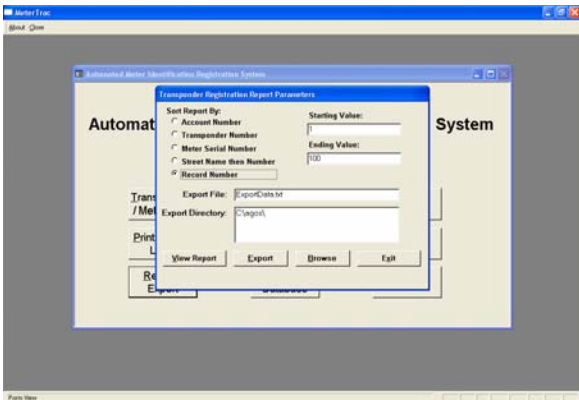

MeterTrac is the first meter management software available today for Water Utilities to manage meter serial numbers, transponder ID's, meter sizes and types. MeterTrac is designed to allow users to directly bar code scan in the meter and transponder numbers into a database that matches them up with your finance department's account numbers and street addresses.

The MeterTrac database allows you to then create a tear resistant label that is wrapped around the cable connecting the Meter and Transponder. The label can then be used as the work order for the installer, telling them where the combination is to be installed.

Finally, the MeterTrac software allows you to export the data back into your finance department billing software for instant, error free uploading of this critical data.

For more information on how MeterTrac can save you hundreds of hours of labor and thousands of dollars in meter management, contact us at:
